

Product Description

The PE42520 SPDT absorptive RF switch is designed for use in Test/ATE and other high performance wireless applications. This broadband general purpose switch maintains excellent RF performance and linearity from 9 kHz through 13 GHz. This switch is a pin-compatible upgraded version of PE42552 with higher power handling of 36 dBm continuous wave (CW) and 38 dBm instantaneous power in 50Ω @ 8 GHz. The PE42520 exhibits high isolation, fast settling time, and is offered in a 3x3 mm QFN package.

The PE42520 is manufactured on Peregrine's UltraCMOS® process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

Features

- HaRP™ technology enhanced
 - Fast settling time
 - No gate and phase lag
 - No drift in insertion loss and phase
- High power handling @ 8 GHz in 50Ω
 - 36 dBm CW
 - 38 dBm instantaneous power
 - 26 dBm terminated port
- High linearity
 - 66 dBm IIP3
- Low insertion loss
 - 0.8 dB @ 3 GHz
 - 0.9 dB @ 10 GHz
 - 2.0 dB @ 13 GHz
- High isolation
 - 45 dB @ 3 GHz
 - 31 dB @ 10 GHz
 - 18 dB @ 13 GHz
- ESD performance
 - 4kV HBM on RF pins to GND
 - 2.5kV HBM on all pins
 - 1kV CDM on all pins

Exceeding absolute maximum ratings may cause permanent damage. Operation should be restricted to the limits in the Operating Ranges table. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS[®] device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS[®] devices are immune to latch-up.

Switching Frequency

The PE42520 has a maximum 25 kHz switching rate when the internal negative voltage generator is used (pin 13 = GND). The rate at which the PE42520 can be switched is only limited to the switching time (*Table 1*) if an external negative supply is provided (pin 13 = $V_{SS,EXT}$).

Switching frequency describes the time duration between switching events. Switching time is the time duration between the point the control signal reaches 50% of the final value and the point the output signal reaches within 10% or 90% of its target value.

Optional External Vss Control ($V_{SS,EXT}$)

For proper operation, the $V_{SS,EXT}$ control pin must be grounded or tied to the V_{SS} voltage specified in *Table 3*. When the $V_{SS,EXT}$ control pin is grounded, FETs in the switch are biased with an internal negative voltage generator. For applications that require the lowest possible spur performance, $V_{SS,EXT}$ can be applied externally to bypass the internal negative voltage generator.

Spurious Performance

The typical spurious performance of the PE42520 is -152 dBm when $V_{SS,EXT} = 0V$ (pin 13 = GND). If further improvement is desired, the internal negative voltage generator can be disabled by setting $V_{SS,EXT} = -3.4V$.

Moisture Sensitivity Level

The Moisture Sensitivity Level rating for the PE42520 in the 16-lead 3x3 mm QFN package is MSL3.

Logic Select (LS)

The Logic Select feature is used to determine the definition for the CTRL pin.

Evaluation Kit

The SPDT switch evaluation board was designed to ease customer evaluation of Peregrine's PE42520. The RF common port is connected through a 50Ω transmission line via the SMA connector, J1. RF1 and RF2 ports are connected through 50Ω transmission lines via SMA connectors J2 and J3, respectively. A 50Ω through transmission line is available via SMA connectors J5 and J6, which can be used to de-embed the loss of the PCB. J4 provides DC and digital inputs to the device.

For the true performance of the PE42520 to be realized, the PCB should be designed in such a way that RF transmission lines and sensitive DC I/O traces are heavily isolated from one another.
