

# Overvoltage and Overcurrent Protection IC and Li+ Charger Front-End Protection IC

Check for Samples : [bq24308](#)

## FEATURES

- Provides Protection for Three Variables:
  - Input Overvoltage
  - Input Overcurrent with Current Limiting
  - Battery Overvoltage
- 30V Maximum Input Voltage
- Supports Up to 1.5A Input Current
- Robust Against False Triggering Due to Current Transients
- Thermal Shutdown
- LDO Mode Voltage Regulation of 5V
- Small 2 mm × 2 mm 8-Pin SON Package

## APPLICATIONS

- Mobile and Smart Phones
- PDAs
- MP3 Players
- Low-Power Handheld Devices
- Bluetooth Headsets

## DESCRIPTION

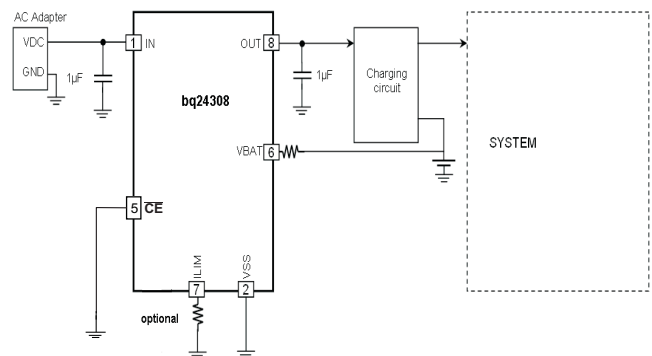

The bq24308 is a highly integrated circuit designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage, the input current and the battery voltage. In case of an input over-voltage condition, the IC immediately removes power from the charging circuit by turning off an internal switch. In the case of an over-current condition, it limits the current to a safe value for a blanking duration before turning the switch off. Battery voltage may also be monitored and if the battery voltage exceeds the specified value the internal switch is turned off. Additionally, the IC also monitors its own die temperature and switches off if it becomes too hot.

The input over-current threshold can be increased using an external resistor. The IC also offers optional protection against reverse voltage at the input using an external P-channel FET.

## PINOUT

## TYPICAL APPLICATION CIRCUIT

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2009, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE DISSIPATION RATINGS

| PACKAGE | $R_{\theta JC}$ | $R_{\theta JA}$ <sup>(1)</sup> |
|---------|-----------------|--------------------------------|
| DSG     | 5°C/W           | 75°C/W                         |

(1) This data is based on using the JEDEC High-K board and the exposed die pad is connected to a Cu pad on the board. The pad is connected to the ground plane by a 2x3 via matrix.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

|                                |  | VALUE                             | UNIT |
|--------------------------------|--|-----------------------------------|------|
| Input voltage                  | IN, PGATE (with respect to VSS)  | –0.3 to 30                        | V    |
|                                | OUT (with respect to VSS)  | –0.3 to 12                        | V    |
|                                | ILIM, $\overline{CE}$ , VBAT (with respect to VSS)   | –0.3 to 7                         | V    |
| Input current                  | IN   | 2.0                               | A    |
| Output current                 | OUT  | 2.0                               | A    |
|                                | PGATE  | 5                                 | mA   |
| ESD Withstand voltages         | All (Human body Model per JESD22-A114-E)   | 2000                              | V    |

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

|            |                          | MIN | MAX | UNIT       |
|------------|--------------------------|-----|-----|------------|

## PIN FUNCTIONS

| PIN                    |     | I/O | DESCRIPTION   |
|------------------------|-----|-----|---|
| NAME                   | NO. |     |   |
| IN                     | 1   | I   | Input power, connect to external DC supply. Connect external 0.1μF (minimum) ceramic capacitor to VSS   |
| OUT                    | 8   | O   | Output terminal to the charging system. Connect external 1μF capacitor (minimum) ceramic capacitor to VSS   |
| VBAT                   | 6   | I   | Battery voltage sense input. Connect to pack positive terminal through a resistor.  |
| NC                     | 4   | –   | Do not connect to any external circuit. This pin may have internal connections used for test purpose.   |
| ILIM                   | 7   | I   | Input over-current threshold programming. An optional external resistor can be used to increase input over-current threshold. Connect a resistor to VSS to increase the OCP threshold.  |
| VSS                    | 2   | –   | Ground terminal   |
| PGATE                  | 3   | O   | Gate drive for optional external P-FET  |
| $\overline{\text{CE}}$ | 5   | I   | Chip enable input. Active low. When $\overline{\text{CE}}$ = High, the input FET is off. Internally pulled down.  |
| ThermalPAD             |     | -   | There is an internal electrical connection between the exposed thermal pad and the VSS pin of the device. The thermal pad must be connected to the same potential as the VSS pin on the printed circuit board. Do not use the thermal pad as the primary ground input for the device. VSS pin must be connected to ground at all times. |

## TYPICAL OPERATING PERFORMANCE

Test conditions (unless otherwise noted) for typical operating performance are:  $V_{IN} = 5\text{ V}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $R_{BAT} = 100\text{ k}\Omega$ ,  $R_{OUT} = 16\Omega$ ,  $T_A = 25^\circ\text{C}$  (see Figure 1 - Typical Application Circuit)

## DETAILED FUNCTIONAL DESCRIPTION

The bq24308 is a highly integrated circuit designed to provide protection to Li-ion batteries from failures of the charging circuit. The IC continuously monitors the input voltage, the input current and the battery voltage. In case of an input over-voltage condition, the IC immediately removes power from the charging circuit by turning off an internal switch. In the case of an over-current condition, it limits the current to a safe value for a blanking duration before turning the switch off. Additionally, the IC also monitors its own die temperature and switches off if it becomes too hot.

The input and over-current threshold is user-programmable. The IC can be controlled by a processor using the CE pin.

### POWER DOWN

The device remains in power down mode when the input voltage at the IN pin is below the under-voltage lock-out threshold, VUVLO. The FET Q1 (see **Figure 3**) connected between IN and OUT pins is off.

### POWER-ON RESET

The device resets all internal timers when the input voltage at the IN pin exceeds the UVLO threshold. The gate driver for the external P-FET is enabled. The IC then waits for duration  $t_{DGL(PGOOD)}$  for the input voltage to stabilize. If, after  $t_{DGL(PGOOD)}$ , the input voltage and battery voltage are safe, FET Q1 is turned ON. The IC has a soft-start feature to control the inrush current. This soft-start minimizes voltage ringing at the input (the ringing occurs because the parasitic inductance of the adapter cable and the input bypass capacitor form a resonant circuit). **Figure 4** shows the power-up behavior of the device. Because of the deglitch time at power-on, if the input voltage rises rapidly to beyond the OVP threshold, the device will not switch on at all, as shown in **Figure 5**.

### OPERATION

The device continuously monitors the input voltage, the input current and the battery voltage as described in detail in the following sections.

#### Input Overvoltage Protection

If the input voltage rises above VOVP, the internal FET Q1 is turned off, removing power from the circuit. As shown in **Figure 6** to **Figure 7**, the response is very rapid, with the FET turning off in less than a microsecond. When the input voltage returns below  $V_{OVP} - V_{hys(OVP)}$  (but is still above UVLO), the FET Q1 is turned on again after a deglitch time of  $t_{ON(OVP)}$  to ensure that the input supply has stabilized. **Figure 8** shows the recovery from input OVP.

#### Input Overcurrent Protection

The device can supply load current up to  $I_{OCP}$  continuously. If the load current tries to exceed this threshold, the current is limited to  $I_{OCP}$  for a maximum duration of  $t_{BLANK(OCP)}$ . If the load current returns to less than  $I_{OCP}$  before  $t_{BLANK(OCP)}$  times out, the device continues to operate (see **Figure 9**). However, if the overcurrent situation persists for  $t_{BLANK(OCP)}$ , FET Q1 is turned off for a duration of  $t_{REC(OCP)}$ . It is then turned on again and the current is monitored all over again (see **Figure 10** and **Figure 11**).

To prevent the input voltage from spiking up due to the inductance of the input cable, Q1 is not turned off rapidly in an overcurrent fault condition. Instead, the gate drive of Q1 is reduced slowly, resulting in a "soft-stop", as shown in **Figure 12**. The over-current threshold can be programmed to level greater than  $I_{OCP}$  by connecting a resistor  $R_{(ILIM)}$  from the  $I_{LIM}$  pin to  $V_{SS}$ . The programmed over-current threshold is given by  $I_{OCP(program)} = I_{OCP} + K_{ILIM} \div R_{(ILIM)}$ .

#### Battery Overvoltage Protection

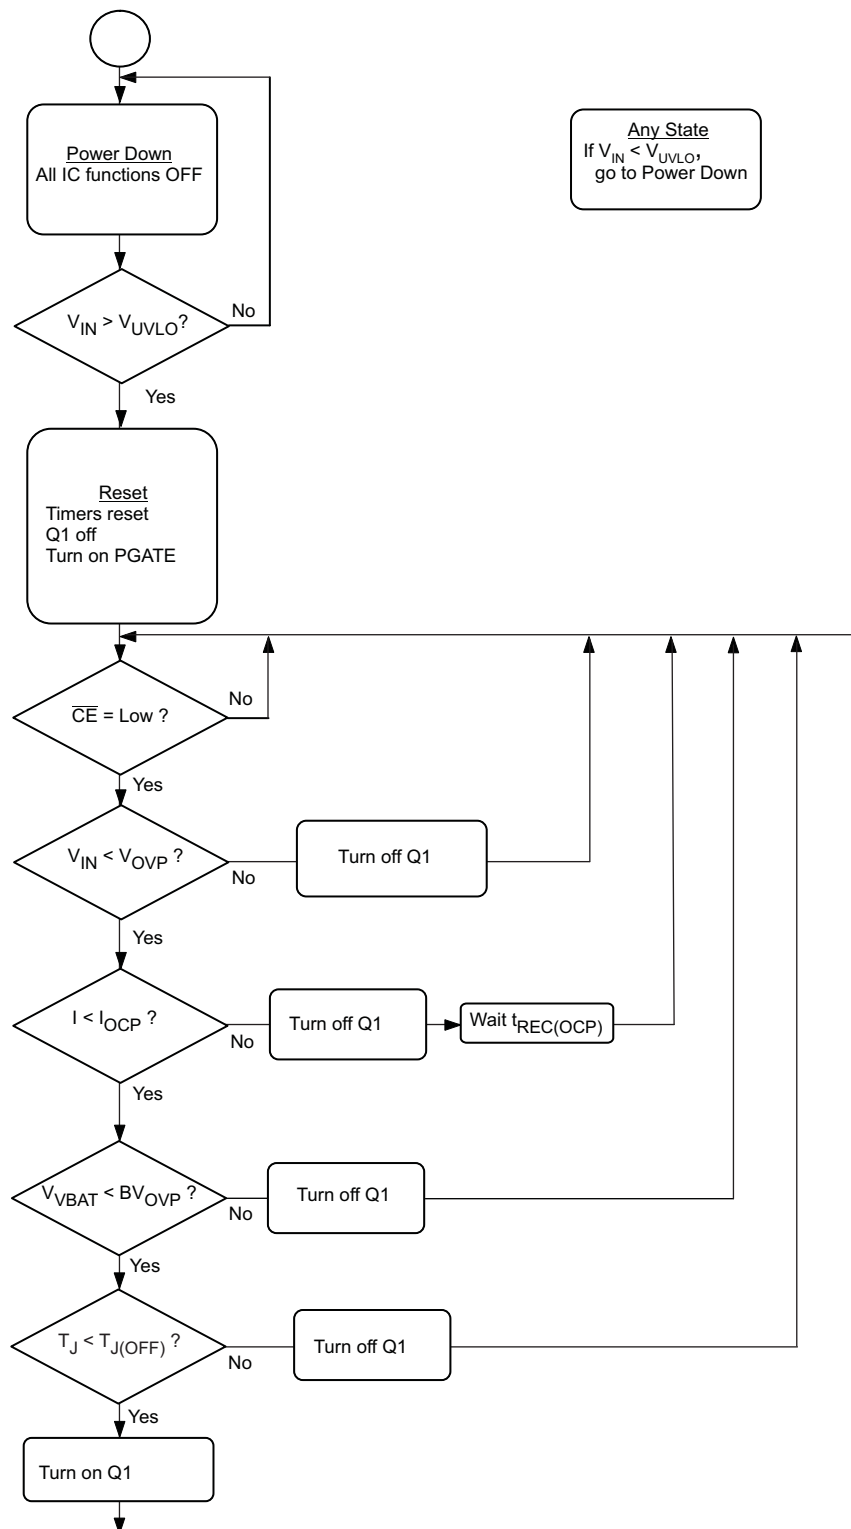

The battery overvoltage threshold  $B_{VOVP}$  is internally set to 4.35V. If the battery voltage exceeds the  $B_{VOVP}$  threshold for longer than  $t_{DGL(BOVP)}$ , FET Q1 is turned off (see **Figure 13**). This switch-off is also a soft-stop. Q1 is turned ON (soft-start) once the battery voltage drops to  $B_{VOVP} - V_{HYS-BOVP}$ .

**Thermal Protection**

If the junction temperature of the device exceeds  $T_{J(OFF)}$ , FET Q1 is turned off. The FET is turned back on when the junction temperature falls below  $T_{J(OFF)} - T_{J(OFF-HYS)}$ .

**Enable Function**

The IC has an enable pin which can be used to enable or disable the device. When the  $\overline{CE}$  pin is driven high, the internal FET is turned off. When the  $\overline{CE}$  pin is low, the FET is turned on if other conditions are safe. The  $\overline{CE}$  pin has an internal pull-down resistor of 200 k $\Omega$  (typical) and can be left floating.

**Figure 23. State Diagram**

## APPLICATION INFORMATION

### Selection of $R_{BAT}$ :

It is strongly recommended that the battery not be tied directly to the VBAT pin of the device, as under some failure modes of the IC, the voltage at the IN pin may appear on the VBAT pin. This voltage can be as high as 30V, and applying 30V to the battery in case of the failure of the device can be hazardous. Connecting the VBAT pin through  $R_{BAT}$  prevents a large current from flowing into the battery in case of failure of the IC. In the interests of safety,  $R_{BAT}$  should have a very high value. The problem with a large  $R_{BAT}$  is that the voltage drop across this resistor because of the VBAT bias current  $I_{VBAT}$  causes an error in the  $BV_{OVP}$  threshold. This error is over and above the tolerance on the nominal 4.35V  $BV_{OVP}$  threshold.

Choosing  $R_{BAT}$  in the range 100k $\Omega$  to 470k $\Omega$  is a good compromise. In the case of IC failure, with  $R_{BAT}$  equal to 100k $\Omega$ , the maximum current flowing into the battery would be  $(30V - 3V) \div 100k\Omega = 270\mu A$ , which is low enough to be absorbed by the bias currents of the system components.  $R_{BAT}$  equal to 100k $\Omega$  would result in a worst-case voltage drop of  $R_{BAT} \times I_{VBAT} \approx 1mV$ . This is negligible compared to the internal tolerance of 50mV on the  $BV_{OVP}$  threshold.

If the Bat-OVP function is not required, the VBAT pin should be connected to VSS.

### Selection of $R_{CE}$ :

The  $\overline{CE}$  pin can be used to enable and disable the IC. If host control is not required, the  $\overline{CE}$  pin can be tied to ground or left un-connected, permanently enabling the device.

In applications where external control is required, the  $\overline{CE}$  pin can be controlled by a host processor. As in the case of the VBAT pin (see above), the  $\overline{CE}$  pin should be connected to the host GPIO pin through a resistor as large as possible. The limitation on the resistor value is that the minimum  $V_{OH}$  of the host GPIO pin less the drop across the resistor should be greater than  $V_{IH}$  of the bq24308  $\overline{CE}$  pin. The drop across the resistor is given by  $R_{CE} \times I_{IH}$ .

### Selection of Input and Output Bypass Capacitors:

The input capacitor  $C_{IN}$  in **Figure 1** and **Figure 2** is for decoupling, and serves an important purpose. Whenever there is a step change downwards in the system load current, the inductance of the input cable causes the input voltage to spike up.  $C_{IN}$  prevents the input voltage from overshooting to dangerous levels. It is strongly recommended that a ceramic capacitor of at least 1 $\mu F$  be used at the input of the device. It should be located in close proximity to the IN pin.

$C_{OUT}$  in **Figure 1** and **Figure 2** is also important: If a very fast ( $< 1\mu s$  rise-time) overvoltage transient occurs at the input, the current that charges  $C_{OUT}$  causes the device's current-limiting loop to kick in, reducing the gate-drive to FET Q1. This results in improved performance for input overvoltage protection.  $C_{OUT}$  should also be a ceramic capacitor of at least 1 $\mu F$ , located close to the OUT pin.  $C_{OUT}$  also serves as the input decoupling capacitor for the charging circuit downstream of the protection IC.

### PCB Layout Guidelines:

1. This device is a protection device, and is meant to protect down-stream circuitry from hazardous voltages. Potentially, high voltages may be applied to this IC. It has to be ensured that the edge-to-edge clearances of PCB traces satisfy the design rules for the maximum voltages expected to be seen in the system.
2. The device uses SON packages with a PowerPAD™. For good thermal performance, the PowerPAD should be thermally coupled with the PCB ground plane. In most applications, this will require a copper pad directly under the IC. This copper pad should be connected to the ground plane with an array of thermal vias.
3.  $C_{IN}$  and  $C_{OUT}$  should be located close to the IC. Other components like  $R_{BAT}$  should also be located close to the IC.

## REVISION HISTORY

NOTE: Page numbers of current version may differ from previous versions.

| Changes from Original (September 2009) to Revision A   | Page |
|--|------|
| • Changed Units from V to A for Input and Output Current spec in Absolute Maximum Ratings table. ....  | 2    |
| • Added ESD Withstand voltage specifications to Absolute Maximum Ratings table. ....                   | 2    |
| • Changed $V_{O(REG)}$ test condition, $I_{OUT}$ value from 50 mA to 250 mA ....                       | 3    |
| • Added $T_J = 0^{\circ}\text{C}$ to $125^{\circ}\text{C}$ to test conditions for $I_{OCP}$ spec. .... | 3    |
| • Changed $Q_{EXT}$ device symbol in the Input Reverse-Polarity Protection schematic. ....             | 4    |

## PACKAGING INFORMATION

| Orderable Device | Status <sup>(1)</sup> | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <sup>(2)</sup> | Lead/Ball Finish | MSL Peak Temp <sup>(3)</sup> |
|------------------|-----------------------|--------------|-----------------|------|-------------|-------------------------|------------------|------------------------------|
| BQ24308DSGR      | ACTIVE                | SON          | DSG             | 8    | 3000        | Green (RoHS & no Sb/Br) | CU NIPDAU        | Level-2-260C-1 YEAR          |
| BQ24308DSGT      | ACTIVE                | SON          | DSG             | 8    | 250         | Green (RoHS & no Sb/Br) | CU NIPDAU        | Level-2-260C-1 YEAR          |

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

## PLASTIC SMALL OUTLINE

4208210/A 08/06

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-Leads (QFN) package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance.  
See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-229.

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

# DSG (S-PWSON-N8) – Minimized Design

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for solder mask tolerances.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
