General Description

The HT71AXXXX devices are CMOS technology voltage regulators which also include an internal voltage detector. The functions of the voltage regulators include a low dropout voltage, good output voltage accuracy as well as the benefits of ultra-low supply current. The inclusion of a voltage detector function in the same device

reduce what would normally be a two chip solution to a single chip solution resulting in reduced product costs. For maximum application flexibility, the voltage detector output is an N-channel open drain.

Functional Description

The HT71Axxxx devices are a series of combined regulator and detector devices. The voltage regulator part of the devices have very low dropout voltage and low current consumption and can supply up to 30mA of output current. The output voltage is available in both 3.3V and 5V types. An input voltage of up to 12V can be accepted on their input pin.

The voltage detector part of the devices can detect an externally supplied voltage on its sense pin. This externally supplied voltage will be compared with a fixed internal reference voltage which can have a range of fixed voltages ranging from 2.4V to 4.4V. When the external

sense voltage falls below the detect voltage the detector output will switch low. The detector output is an open drain NMOS type therefore users must connect an external pull-high resistor for correct operation. The voltage detectors consist of a high-precision and low power consumption standard voltage source as well as a comparator, hysteresis circuit, and an output driver. CMOS technology ensures low power consumption. Although designed primarily as fixed voltage detectors, these devices can be used with external components to detect user specified threshold voltages.
