

# DP8051CPU

## Pipelined High Performance 8-bit Microcontroller ver 4.02

### OVERVIEW

DP8051CPU is an **ultra high performance, speed optimized** soft core of a single-chip 8-bit embedded controller dedicated for operation with **fast** (typically on-chip) and **slow** (off-chip) **memories**. The core has been designed with a special concern about **performance to power consumption** ratio. This ratio is extended by an advanced power management unit **PMU**.

DP8051CPU soft core is 100% binary-compatible with the industry standard 8051 8-bit microcontroller. There are two configurations of DP8051CPU: **Harward** where internal data and program buses are separated, and **von Neumann** with common program and external data bus. DP8051CPU has Pipelined RISC architecture **10 times faster** compared to standard architecture and executes **85-200 million instructions** per second. This performance can also be exploited to great advantage in **low power** applications where the core can be clocked over ten times more slowly than the original implementation for no performance penalty.

DP8051CPU is delivered with **fully automated testbench** and **complete set of tests** allowing easy package validation at each stage of SoC design flow.

### CPU FEATURES

- 100% software compatible with industry standard 8051
- Pipelined RISC architecture enables to execute instructions 10 times faster compared to standard 8051
- 24 times faster multiplication
- 12 times faster addition
- Up to 256 bytes of internal (on-chip) Data Memory
- Up to 64K bytes of internal (on-chip) or external (off-chip) Program Memory
- Up to 16M bytes of external (off-chip) Data Memory
- User programmable Program Memory Wait States solution for wide range of memories speed
- User programmable External Data Memory Wait States solution for wide range of memories speed
- De-multiplexed Address/Data bus to allow easy connection to memory
- Dedicated signal for Program Memory writes.
- Interface for additional Special Function Registers

- Fully synthesizable, static synchronous design with positive edge clocking and no internal tri-states
- Scan test ready
- **2.0 GHz virtual** clock frequency in a 0.25u technological process

## PERIPHERALS

- DoCD™ debug unit
  - Processor execution control
    - Run
    - Halt
    - Step into instruction
    - Skip instruction
  - Read-write all processor contents
    - Program Counter (PC)
    - Program Memory
    - Internal (direct) Data Memory
    - Special Function Registers (SFRs)
    - External Data Memory
  - Code execution breakpoints
    - one real-time PC breakpoint
    - unlimited number of real-time OPCODE breakpoints
  - Hardware execution watch-point
    - one at Internal (direct) Data Memory
    - one at Special Function Registers (SFRs)
    - one at External Data Memory
  - Hardware watch-points activated at a certain address by any write into memory
  - address by any read from memory
  - address by write into memory a required data
  - address by read from memory a required data
  - Unlimited number of software watch-points
    - Internal (direct) Data Memory
    - Special Function Registers (SFRs)
    - External Data Memory
  - Unlimited number of software breakpoints
    - Program Memory(PC)
  - Automatic adjustment of debug data transfer speed rate between HAD and Silicon
  - JTAG Communication interface
- Power Management Unit
  - Power management mode
  - Switchback feature
  - Stop mode
- Interrupt Controller
  - 2 priority levels
  - 2 external interrupt sources

## CONFIGURATION

The following parameters of the DP8051CPU core can be easily adjusted to requirements of dedicated application and technology. Configuration of the core can be prepared by effortlessly changing appropriate constants in package file. There is no need to change any parts of the code.

- Internal Program Memory
  - synchronous
  - asynchronous
- Internal Program ROM
  - Memory size
  - 0 - 64kB
- Internal Program RAM
  - Memory size
  - 0 - 64kB
- Internal Program Memory
  - fixed size
  - true
  - false
- Interrupts
  - subroutines
  - location
- Power Management Mode
  - used
  - unused
- Stop mode
  - used
  - unused
- DoCD™ debug unit
  - used
  - unused

Besides mentioned above parameters all available peripherals and external interrupts can be excluded from the core by changing appropriate constants in package file.

## DELIVERABLES

- ◆ Source code:
  - ◇ VHDL Source Code or/and
  - ◇ VERILOG Source Code or/and
  - ◇ Encrypted, or plain text EDIF netlist
- ◆ VHDL & VERILOG test bench environment
  - ◇ Active-HDL automatic simulation macros
  - ◇ ModelSim automatic simulation macros
  - ◇ Tests with reference responses
- ◆ Technical documentation
  - ◇ Installation notes
  - ◇ HDL core specification
  - ◇ Datasheet
- ◆ Synthesis scripts
- ◆ Example application
- ◆ Technical support
  - ◇ IP Core implementation support
  - ◇ 3 months maintenance
    - Delivery the IP Core updates, minor and major versions changes
    - Delivery the documentation updates
    - Phone & email support

All trademarks mentioned in this document are trademarks of their respective owners.

## LICENSING

Comprehensible and clearly defined licensing methods without royalty fees make using of IP Core easy and simply.

Single Design license allows using IP Core in single FPGA bitstream and ASIC implementation. It also permits FPGA prototyping before ASIC production.

Unlimited Designs license allows using IP Core in unlimited number of FPGA bitstreams and ASIC implementations.

In all cases number of IP Core instantiations within a design, and number of manufactured chips are unlimited. There is no time of use limitations.

- Single Design license for
  - VHDL, Verilog source code called HDL Source
  - Encrypted, or plain text EDIF called Netlist
- Unlimited Designs license for
  - HDL Source
  - Netlist
- Upgrade from
  - Netlist to HDL Source
  - Single Design to Unlimited Designs

## DESIGN FEATURES

### ◆ PROGRAM MEMORY:

The DP8051CPU soft core is dedicated for operation with Internal and External Program Memory. Internal Program Memory can be implemented as:

- ROM located in address range between  $0x0000 \div (ROM_{size}-1)$
- RAM located in address range between  $(RAM_{size}-1) \div 0xFFFF$

External Program Memory can be implemented as ROM or RAM located in address range between  $ROM_{size} \div RAM_{size}$ .

### ◆ INTERNAL DATA MEMORY:

The DP8051CPU can address Internal Data Memory of up to 256 bytes. The Internal Data Memory can be implemented as Single-Port synchronous RAM.

### ◆ EXTERNAL DATA MEMORY:

The DP8051CPU soft core can address up to 16 MB of External Data Memory. Extra DPX (*Data Pointer eXtended*) register is used for segments swapping.

### ◆ USER SPECIAL FUNCTION REGISTERS:

Up to 104 External (user) Special Function Registers (ESFRs) may be added to the DP8051CPU design. ESFRs are memory mapped into Direct Memory between addresses 0x80 and 0xFF in the same manner as core SFRs and may occupy any address that is not occupied by a core SFR.

### ◆ WAIT STATES SUPPORT:

The DP8051CPU soft core is dedicated for operation with wide range of Program and Data memories. Slow Program and External Data memory may assert a memory Wait signal to hold up CPU activity.

| stop           | output | Stop mode indicator                   |

## UNITS SUMMARY

**ALU** – Arithmetic Logic Unit performs the arithmetic and logic operations during execution of an instruction. It contains accumulator (ACC), Program Status Word (PSW), (B) registers and related logic such as arithmetic unit, logic unit, multiplier and divider.

**Opcode Decoder** – Performs an instruction opcode decoding and the control functions for all other blocks.

**Control Unit** – Performs the core synchronization and data flow control. This module is di-

rectly connected to Opcode Decoder and manages execution of all microcontroller tasks.

**Program Memory Interface** – Contains Program Counter (PC) and related logic. It performs the instructions code fetching. Program Memory can be also written. This feature allows usage of a small boot loader loading new program into RAM, EPROM or FLASH EEPROM storage via UART, SPI, I2C or DoCD™ module.

**External Memory Interface** - Contains memory access related registers such as Data Page High (DPH), Data Page Low (DPL) and Data Pointer eXtended (DPX) registers. It performs the external Program and Data Memory addressing and data transfers. Program fetch cycle length can be programmed by user. This feature is called Program Memory Wait States, and allows core to work with different speed program memories.

**Synchronous eXternal Data Memory (SXDM) Interface** – contains XDATA memory access related logic allowing fast access to synchronous memory devices. It performs the external Data Memory addressing and data transfers. This memory can be used to store large variables frequently accessed by CPU, improving overall performance of application.

**Internal Data Memory Interface** – Internal Data Memory interface controls access into the internal 256 bytes memory. It contains 8-bit Stack Pointer (SP) register and related logic.

**User SFRs Interface** – Special Function Registers interface controls access to the special registers. It contains standard and used defined registers and related logic. User defined external devices can be quickly accessed (read, written, modified) using all direct addressing mode instructions.

**Interrupt Controller** – Interrupt control module is responsible for the interrupt manage system for the external and internal interrupt sources. It contains interrupt related registers such as Interrupt Enable (IE), Interrupt Priority (IP) and (TCON) registers.

**Power Management Unit** – Block contains advanced power saving mechanisms with switchback feature, allowing external clock control logic to stop clocking (Stop mode) or run core in lower clock frequency (Power Management Mode) to significantly reduce power consumption. Switchback feature allows

UARTs, and interrupts to be processed in full speed mode if enabled. It is very desired when microcontroller is planned to use in portable and power critical applications.

**DoCD™ Debug Unit** – it's a real-time hardware debugger provides debugging capability of a whole SoC system. In contrast to other on-chip debuggers DoCD™ provides non-intrusive debugging of running application. It can halt, run, step into or skip an instruction, read/write any contents of microcontroller including all registers, internal, external, program memories, all SFRs including user defined peripherals. Hardware breakpoints can be set and controlled on program memory, internal and external data memories, as well as on SFRs. Hardware breakpoint is executed if any write/read occurred at particular address with certain data pattern or without pattern. Two additional pins CODERUN, DEBUGACS indicate the state of the debugger and CPU. CODERUN is active when CPU is executing an instruction. DEBUGACS pin is active when any access is performed by DoCD™ debugger. The DoCD™ system includes **JTAG interface** and complete set of tools to communicate and work with core in real time debugging. It is built as scalable unit and some features can be turned off to save silicon and reduce power consumption. A special care on power consumption has been taken, and when debugger is not used it is automatically switched in power save mode. Finally whole debugger is turned off when debug option is no longer used.

## PROGRAM CODE SPACE IMPLEMENTATION

The figure below shows an example Program Memory space implementation in systems with DP8051CPU Microcontroller core. The On-chip Program Memory located in address space between 0kB and 1kB is typically used for BOOT code with system initialization functions. This part of the code is typically implemented as ROM. The On-chip Program Memory located in address space between 60kB and 64kB is typically used for timing critical part of the code e.g. interrupt subroutines, arithmetic functions etc. This part of the code is typically implemented as RAM and can be loaded by the BOOT code during initialization phase from Off-chip memory or through RS232 interface from external device. From the two mentioned above spaces program code is

executed without wait-states and can achieve a top performance up to 200 million instructions per second (many instructions executed in one clock cycle). The Off-chip Program Memory located in address space between 1kB and 60kB is typically used for main code and constants. This part of the code is usually implemented as ROM, SRAM or FLASH device. Because of relatively long access time the program code executed from mentioned above devices must be fetched with additional Wait-States. Number of required Wait-States depends on memory access time and DP8051CPU clock frequency. In most cases the proper number of Wait-States cycles is between 2-5. The READY pin can be also dynamically modulated e.g. by SDRAM controller.

The figure below shows a typical Program Memories connections in system with DP8051CPU Microcontroller core.

The described above implementation should be treated as an example. All Program Memory spaces are fully configurable. For timing-critical applications whole program code can be implemented as on-chip ROM and (or) RAM and executed without Wait-States, but for some other applications whole program code can be implemented as off-chip ROM or FLASH and executed with required number Wait-State cycles.

## PERFORMANCE

The following tables give a survey about the Core area and performance in Programmable Logic Devices after Place & Route (CPU features and peripherals have been included):

| Device     | Speed grade | F <sub>max</sub> |
|------------|-------------|------------------|
| FLEX10KE   | -1          | 57 MHz           |
| ACEX1K     | -1          | 56 MHz           |
| APEX20K    | -1          | 50 MHz           |
| APEX20KE   | -1          | 68 MHz           |
| APEX20KC   | -7          | 79 MHz           |
| APEX-II    | -7          | 74 MHz           |
| MERCURY    | -5          | 101 MHz          |
| CYCLONE    | -6          | 93 MHz           |
| CYCLONE-II | -6          | 95 MHz           |
| STRATIX    | -5          | 89 MHz           |
| STRATIX-II | -3          | 160 MHz          |

Core performance in ALTERA® devices

For a user the most important is application speed improvement. The most commonly used arithmetic functions and theirs improvement are shown in table below. Improvement was

DP8051 family of Pipelined High Performance Microcontroller Cores

The main features of each DP80390 family member have been summarized in table below. It gives a briefly member characterization helping user to select the most suitable IP Core for its application. User can specify its own peripheral set (including listed below and the others) and requests the core modifications.

| Design     | Architecture speed grade |             |          |    | Program Memory space |     |     | Stack space size | Internal Data Memory space | External Data Memory space | External Data / Program Memory Wait States | Power Management Unit | Interface for additional SFRs | Interrupt sources | Interrupt levels | Data Pointers | Timer/Counters | UART | I/O Ports | Compare/Capture | Watchdog | Master I <sup>2</sup> C Bus Controller | Slave I <sup>2</sup> C Bus Controller | SPI | Fixed Point Coprocessor | Floating Point Coprocessor |
|------------|--------------------------|-------------|----------|----|----------------------|-----|-----|------------------|----------------------------|----------------------------|--------------------------------------------|-----------------------|-------------------------------|-------------------|------------------|---------------|----------------|------|-----------|-----------------|----------|----------------------------------------|---------------------------------------|-----|-------------------------|----------------------------|
